

ECONOMIC PROPOSAL • BETA PROGRAM

Automated BESS Monitoring & Reporting

A pricing and value proposal for the investors and stakeholders of the plant

The stakes: a 1 GW asset under a hard contractual guarantee

37

Stations

74

ESS units

888

Physical racks

369,408

Battery cells

518,000

Data channels

98% GAA

Guaranteed Annual Availability owed to CATL

Calculated hourly, per ESS unit, on a DC measurement basis, and accumulated annually. This is not an internal KPI — it is the figure the plant reports to its offtake partner. Every report that goes out either supports this number or explains, in writing, why it cannot be certified yet.

Manual reporting doesn't scale to this — and a wrong number isn't a typo

1

Hours, every cycle

2–3 hours of manual work per day, across 888 racks, just to assemble one report.

2

No shared language for “we don't know”

Most tooling can't distinguish “no data,” “value is zero,” and “not enough data to certify” — they get treated the same.

3

A wrong figure is a commercial event

A miscalculated contractual number reaching CATL isn't an internal slip — it's a credibility problem with the offtake partner.

Real example, already caught

A direct calculation once produced a “202% round-trip efficiency” and, separately, a “54% availability” that was actually a data-coverage problem. Both were blocked before publication — by design, not by luck.

What Quorelia actually does

Monitoring and automated reporting — not a maintenance dispatch or field-service tool.

Automated daily & monthly reports

Generated on schedule, straight from plant data — no manual pull, no manual formatting.

Defensible, provenance-backed figures

Every number is re-derived by an independent path before publishing. If the two don't match, it doesn't go out.

Coverage-aware verdicts

When data coverage is too thin, the contractual verdict is withheld and explained — never guessed.

Bilingual by default

Every report and portal renders in English and Spanish, no separate translation step.

Alert-based, not 24/7 screen-watching

The system watches continuously; your people get dispatched only when something real needs attention.

How it works: from raw plant data to a defensible report

The same pipeline your dashboards and reports run on — nothing hidden.

Raw data, calculated results, and provenance are stored together — every number that reaches a report has a documented explanation.

Not a concept — already validated against real plant data

670

automated tests run against the
reporting engine before any figure ships

2

erroneous figures caught and blocked
before they could be published

6

findings surfaced that weren't part of
the original scope of work

From the reference run analyzed for this proposal — not illustrative figures.

What this is worth, in hours and dollars

2–3 h → ~2 min

Daily manual reporting time, per cycle, across 888 racks

500–750 h

Saved per year across 250 business days

US\$13,000–21,000

Estimated annual labor cost avoided (CLP 12–19M)

2 for 2

Erroneous contractual figures caught before reaching CATL

These figures cover labor time alone. They do not price the larger exposure this proposal actually addresses: the commercial and reputational risk of an incorrect contractual figure reaching CATL.

What this class of service typically costs

Annualized cost, monitoring-only services, for a 1,000 MW BESS asset (US\$ thousands)

Illustrative — based on public per-MW benchmarks for BESS monitoring-only services (US\$300–1,000/MW/year). Not a quote from any specific vendor.

Proposed structure: Beta Program

Priced per plant and per MW, so it scales cleanly beyond this first site.

RECURRING FEE — BETA RATE

US\$500 / month per plant + **US\$2** / MW / month

WORKED EXAMPLE • THIS PLANT (1,000 MW)

US\$2,500 / month

≈ US\$30,000 / year • 12-month initial term

Includes: automated daily/monthly reports, provenance-backed figures, coverage-aware verdicts, bilingual EN/ES, alert routing.

ONE-TIME SETUP & DATA ONBOARDING

US\$6,000

billed once, at contract signature

Covers full-history KPI extraction across all 518,000 channels, deduplication and mapping of the physical asset catalog, and building the initial ~30 TB annual data store — verified before go-live, not estimated after.

1

Months 0–6

Beta rate in effect; joint checkpoint on scope and data quality.

2

Months 6–12

Rate reassessed against scope and market benchmarks — in writing.

3

Month 12+

Renewal at a market-aligned rate, or a renegotiated scope.

In exchange for beta pricing

A founding-client price should buy something back, not just be a discount.

Reference-client rights

Case study, a reference call for future prospects, and logo/name use in Quorelia materials.

Structured feedback partnership

Regular input during the beta period as the platform and its report set mature.

Accepted step-up schedule

The month-6 and month-12 review points agreed upfront, not renegotiated later under pressure.

Extended initial term (optional)

A longer commitment in exchange for holding the beta rate for the full term.

Proposed next steps

Let's make the next report the one nobody has to double-check.

Quorelia · hello@quorelia.io

This proposal is prepared for internal discussion and is not a binding offer. Pricing, market-benchmark, and savings figures are estimates to be confirmed before signature.
