

QUORELIA

24/7 INTELLIGENT OVERSIGHT FOR RENEWABLE ENERGY

Your energy. Always under watch.

AI-powered monitoring, alerts, diagnostics, and automated reporting for solar, wind, and battery storage assets.

Who we are

Built inside a live 1,000 MW BESS asset — not designed in a vacuum.

Quorelia grew out of the automated reporting system built for one of the largest battery storage assets in Chile — turning raw SCADA data into the contractual figures its investors and offtake partner rely on. What started as a single plant's reporting layer is becoming an independent intelligence platform for renewable energy assets everywhere.

ORIGIN

Built for a live 1,000 MW BESS asset in northern Chile.

FOCUS

Monitoring and automated reporting — not maintenance dispatch.

REACH

Solar · Wind · ESS, in English and Spanish.

MISSION

Make every number a renewable energy asset reports provable — monitored continuously, verified independently, and delivered on schedule.

VISION

A world where no renewable energy asset operates unwatched — and every plant's numbers are trusted by default.

Our objectives

How we intend to earn the trust the mission talks about.

1

Earn trust plant by plant

Start with defensible monitoring and reporting on real assets — not a land-grab of features.

2

Extend to every asset class

One system across solar, wind, and storage, not a point tool for a single technology.

3

Stay disciplined on scope

Grow through verification and reporting depth — not by quietly becoming a maintenance dispatch tool.

4

Build toward a true platform

Move from a single-plant beta engagement to a multi-client product, without loosening the provenance standard.

Renewable assets generate more data than anyone can watch

And most reporting still runs on spreadsheets, screenshots, and someone's Tuesday afternoon.

1

Manual reporting doesn't scale

Hours of manual work per report — multiplied across every site, every month.

2

“No data” and “zero” aren’t the same thing

Most tools can’t tell the difference — and a contractual figure can live or die on it.

3

A wrong number is a commercial event

An incorrect contractual figure isn’t a typo. It’s a credibility problem with your offtake partner or investor.

The independent intelligence layer between your plant and the people responsible for it

Not another SCADA. Not a maintenance system. Trust in the numbers.

01

Monitor

Real-time visibility into every plant, inverter, rack, and channel — solar, wind, or ESS.

02

Alert

Automatic alarms the moment a threshold is breached, a channel drops, or a fault appears.

03

Diagnose

Findings are traced to source data and provenance — not just flagged and left for someone to chase.

04

Report

Daily and monthly reports build themselves, in English and Spanish, ready for stakeholders.

From raw plant data to a finished report

Four steps, running on a schedule you control.

Raw data, calculated results, and provenance are stored together — so every number that reaches a report has a documented explanation.

What makes it defensible

Every design choice traces back to one goal: a number you can stand behind.

Provenance-backed figures

Every number is re-derived by an independent path before publishing. If the two don't match, it doesn't go out.

Coverage-aware verdicts

When data coverage is too thin, the contractual verdict is withheld and explained — never guessed.

Bilingual by default

Every report and portal renders in English and Spanish, no separate translation step.

Works with your existing SCADA

Integrates with common SCADA, inverter, and BMS platforms — no rip-and-replace.

Solar • Wind • ESS

One system across asset classes, not a point tool for a single technology.

Alert-based, not 24/7 screen-watching

The system watches continuously; your people get dispatched only when something real needs attention.

Validated against real BESS plant data — in production

670

automated tests run against the reporting engine before any figure ships

2

erroneous figures caught and blocked before they could be published

6

findings surfaced that weren't part of the original scope of work

From a live 1,000 MW BESS asset — not illustrative figures.

Built for the people who answer for the numbers

Asset owners

Portfolio-level confidence in the figures reported up to your own board and investors.

EPCs & O&M teams

Cut report-prep time from days to minutes, with consistent formatting across every site.

Investors & stakeholders

An independent, provenance-backed check on the numbers you're financially exposed to.

GLOBAL · ENGLISH & SPANISH · SOLAR · WIND · ESS

If you remember one thing:

Quorelia is the independent intelligence layer between your renewable energy assets and the people financially responsible for them.

You don't need another dashboard. You need to trust the numbers in it.

QUORELIA

Let's put your next report to the test.

When your plant never sleeps, neither does your monitoring.
